

Triple + Double = So Much Trouble

Published by [Edward Clark](#) in [Java](#) ▾

[algorithms](#)[regex](#)[validation](#)

Create a function that takes two integers and returns `true` if a number repeats three times in a row at any place in `num1` **AND** that same number repeats two times in a row in `num2`.

Examples

```
trouble(451999277, 41177722899) → True
```

```
trouble(1222345, 12345) → False
```

```
trouble(666789, 12345667) → True
```

```
trouble(33789, 12345337) → False
```

Notes

You can expect every test case to contain exactly two integers.
